8 #####
9 """
10 Performs free-vibration analysis of a Single Degree of Freedom (SDOF)
11 structure using OpenSeesPy, comparing elastic and inelastic spring behavior.
12 Key features include:
13
14 1. Implements both elastic (linear) and hysteretic (nonlinear) material models for
15 structural springs.
16 2. Supports initial conditions for displacement, velocity, and acceleration.
17 3. Uses Newmark's method for time integration with Newton-Raphson iteration.
18 4. Calculates damping ratios using logarithmic decrement from response peaks.
19 5. Generates force-displacement backbone curves for inelastic material.
20 6. Tracks and plots time-history responses (displacement, velocity, acceleration, reactions).
21 7. Compares elastic vs inelastic system performance.
22 8. Includes convergence checks and analysis stability monitoring.
23 9. Outputs model data in JSON format for post-processing.
24 10. Provides theoretical validation through natural frequency calculations.
25
26 Particularly useful for earthquake engineering applications,
27 allowing evaluation of structural response under free vibration
28 with different material nonlinearities and damping characteristics.
29 The hysteretic material model captures energy dissipation
30 inelastic deformation, while the elastic case serves as a reference for linear behavior.
