12 Performs a comparative analysis of reinforced concrete columns' axial force-moment (P-M)
13 interaction behavior using OpenSeesPy.
14
15 1. Objective:
16 Evaluates how steel plate , rebar reinforcement strain hardening and ultimate strain criteria affect P-M
17 interaction capacity, crucial for seismic design where ductility matters.
18
19 2. Materials:
20 - Concrete: Confined (core) and unconfined (cover) modeled with 'Concrete01' material laws.
21 - *Steel: Two models - 'Steel01' (elastic-perfectly plastic) vs. 'Hysteretic' (includes hardening & fracture).
22
23 3. Section Modeling: Creates a rectangular RC cross-section with fiber discretization. Core concrete is confined,
24 cover concrete unconfined, with rebars placed at edges and mid-depth.
25
26 4. Analysis Method: Uses a displacement-controlled approach to simulate increasing curvature/strain. For each strc
27 - Applies strain compatibility (plane sections remain plane)
28 - Computes axial force (P) and moment (M) using nonlinear static analysis.
29
30 5. Key Outputs:
31 - P-M interaction diagrams
32 - Moment-curvature relationships
33 - Neutral axis depth trends
34
